FALCON

WEIST -- Aarseth

The Falcon -- a deadly new rocket -- rolls out of America's arsenal of guided missiles. The lethal little weapon can be hooked under the wings of speedy Air Force interceptor planes and fired in flight.

An artists sketch shows the interceptor tracking an enemy aircraft and firing the Falcon which reportedly is so accurate that virtually every hit is a sure kill.

Now, an actual demonstration of the six-foot, one hundred pound missile.

Inside the interceptor, radar is used to sight the target. When the plane gets within range -- from three to five miles -- The Falcon is released automatically and dashes to the kill at supersonic speed.

The tiny missile can destroy the biggest bomber in the world and is designed to knock down any enemy aircraft carrying the hydrogen bomb long before they reach the United States.
