

THERE'LL BE FOUR MEN IN THE MOON.

A mock-up of the spacecraft that will land the first Americans on the Moon. There'll be three of them in the command-module, as it's called, but with more room than Colonel Glenn had, and taking their food from tubes. Two other modules will hold equipment and moon landing gear. The problems are, to provide enough power to send the capsule to the moon, to guide it accurately, and get the men back. So roll on the day when the Man in the Moon gets his first visitors from the States, and they emerge for a good look round.
