

ALUMINIUM FROM CANADA.

The **Shipsaw Dam, Quebec**; a great hydro-electric project which, when finished, will develop a million and a half horse-power for the production of aluminium. A hundred million dollars is being spent in the construction of this great Canadian power plant. Dynamite blasts deep into the solid rock.

Harnessed water will produce electric power to make 750 million pounds of aluminium. That amount of metal in terms of aircraft is something to think about. One day, maybe, it'll have something to do with the making of saucers.
