(7). TITLE.:- GYMNO FRAME.

Picture.:- This contraption has been adopted by the Austrian Army. It will teach the troops how to stand a shake-up --

--and also how to retreat and advance at the same time. This young lady certainly appears to be going more than one way at once.

This particular over-and-over business is said to make for suppleness of the lower limbs. It's good exercise, anyway.

Now a couple of energetic young ladies give us a few cartwheels. Venus won't be in it with them when they've finished --

--according to the inventor's claims. It's supposed to round off corners --

--and impart health in large portions. At any rate it couldn't do much harm, unless of course one happened to let go of the handle !

(8). TITLE.:- WORLD'S HIGHEST CRANE.

Picture.:- When it's finished, this big crane will raise over a hundred tons at a lift.

The structure is already 135 feet high, and men are hard at work, building her up to 175 feet, which will be her height when the job is finished. Here we are at the top stage -- so far.

There's a regular workshop right up here -- and these fellows are working away just as if there wasn't a big drop if any of them slipped.

The vessels in the docks far below look like little toy boats from the sixpenny stores.

It will be the largest crane in the world -- or, perhaps it will be safer to say, the largest in Britain, when it is completed.
